Checkbox html form value

This is the third article in the values of the shape elements by getting using the JavaScript series. In this article we will see how to get the value of the check box and the radio button. Get a radio element and is controlled the value The radio buttons in a module can be grouped together using the same name attribute, so that if one of them is checked, all others are automatically unchecked. Let's look at an example: < < label for="work_abroad_y"> Yes No To recover the value of the controlled radio button, we can write a simple JavaScript function: getRadioCheckedValue(radio_name) { var oRadio = document.forms[0]. elements[radio_name]; for(var i = 0; i < oRadio.length; i++) {if(oRadio[i].checked) {return reference group oRadio[i] A control box in a module has only two states (checked or uncontrolled) and is independent of the status of other control boxes in the module, unlike the radio buttons that can be grouped together under a common name. Let's look at the HTML code showing two checkboxes: Email me matching job Enable Recruiters to contact me directly To access these checkboxes, their values and their states, we can use the following javascript function: Checkbox(orCheckbox) { var checkbox_val = oCheckbox.value; if (orCheckbox.check= true) { alert("Checkbox with name = " + oCheckbox.name + " and value =" + checkbox + " is checked"); box + We can then use the function in this way: oCheckBox1 = oForm.elements["email_alerts"]; oCheckBox2 = oForm.elements["recruiter_contact"]; testCheckbox(orCheckBox1); testCheckbox(orCheckBox2); Example See demo The text area for the "work permit" is disabled if "No" is chosen for "Willing to work abroad" and vis-versa We write aboutClick event handler for each of the options. Before taking a look at HTML: Do you want to work abroad? "Help" Information on the acquisition of work permit / visa: Thecode: function disableElement(obj) { obj.value = ' - N.A. - '; obj.disabled = true; } function enabled Element(obj.value = obj.disabled = false; } Download code Prev: How to get the value of a form element : Breakdown and Checkbox Inputs lists can only have two states: controlled or uncontrolled. They may have any value, but or send that value (checked) or not (uncontrolled) with a presentation of the module. The default is unchecked. It is possible to check that in HTML like this:
