Notepad plugin manager 1. 4. 12

I've been a Notepad++ fan for years. And as soon as a 64-bit version was born, I adopted it. But for a few months I have a new laptop, and apparently I did not get the plugin manager with the latest new installation. And only now I have taken the opportunity to solve and write about it. I found that the plugin manager is available from April 2017 on GitHub, version 1.49. I downloaded the zip from the mentioned location, choose the _x64 version: Then he unplugged it in my Notepad++ folder: Then it started Notepad++ and the plugin manager appears: So now I can format my XML files again... Update 2018-07-03: the latest version can be found directly here. Changes Download XML Installation File Documentation Plugin Developers Sending Credits Contact Plugin Manager changes is a Notepad+ plugin that allows you to install, update and remove the plugins from Notepad++. An XML file hosted centrally holds the list of plugins, which the plugin manager downloads and processes against the list of installed plugins. Important Note for Vista / Windows 7: To update the plugin manager at 1.0.8 , you must run Notepad++ as administrator, update plugin manager, so everything will run correctly under a normal user. The future updates of Plugin Manager will be automatically executed as administrator. Click here to help upgrade to Plugin Manager 1.0.8 Install, update and remove all existing plugins Report when an installed plugin has an available update and allowthe user to update directly Calculate dependencies between the plugins, any plugin may depend on another plugin, which will be installed automatically if the user installs the initial plugin Install all the additional files and the plugin file itself (e.g. config, doc, extra libraries) Automatic installation of the correct version (ANSI/Unicode) for your Notepad+ Validation of copied DLLs, against a central list of valid files. This mitigates the risk of automatically downloading updates. Only plug-ins compatible with the Notepad+ are shown Plugins can be inserted into categories - a suggestion was made of "Official, Common and Others". Currently all plugins are in the category Others, as I think there must be a certain agreement on what determines an official plugin and what plugins are common. Plugin Manager is able to update, and will notify you when an update is available Proxies are supported, just change the Updates setting can be ignored, and the user will not be notified again to that update, until a new version of that plugin is released. The local plugin list file is downloaded only when something has changed - the MD5sum file is compared to the server version, and if it is different, a new copy is downloaded. News for 0.9: Works with plugins installed several times - update them all or individually 1.4.9 Do not force the use of local cache when downloading the plugin list (responding the file is currenttime) New URL plugins for x64 1.4.8 Minor change to plugin list hash URL for hashes to allow the correct hashes to be used Improvements of performance by cppcheck (thanks @chcgATA) 1.4.7 Fix the problem with download plugin when hash corresponds Improvements of performance by cppcheck (thanks @chcgATA) Fix small memory loss (thanks for gupre security fixes (thanks @chcg) First construction with x64 build (humidity thanks to @chcg) 1.4.3 Modify the sponsor link to point to the English language page (thanks sm4rk0) 1.4.2 Fix bug crash when you click in the update notification window (thanks cmeriaux) 1.4.1 Change URL for the list of plugins (make HTTPS) Add option to This unfortunately does not solve the people who update from 1.0.8, who will still have a notice when updating PM to 1.3.x, that the GPUP version does not match. 1.3.2 Remove Proxy settings from dialog box 1.3.1 Remove the username and password of the unneeded proxy from the ini settings file if they are there 1.3.01.2.0 download now using wininet bees instead of libcurl. then now using system proxy (like ie and chrome,) and smaller binaries. better uac support. if you start notepad+ as a normal user, then install something, n+ will be restarted as the same user (not as administrator according to previous versions) 1.0.8 controls gpup.exe version is correct to ensure the update from the previous version has been successful 1.0.7 fix for the upgrade fixed manager same now uses main fileversion instead of translated fileversion to detect version 1.0.5 library correctly supported url validation modified in ngr dll dynamically uploading (snack side has been removed) 1.0.3 uninstall correction details for appd plugins infinite fixed loops when the download path is actually a cryptally uploaded site Crypt32.dll timeout for added link during download 1.0.2 support for authenticated proxy(spspi (automatic windows) authenticated proxies are not supported) list now hosted on the improved distribution systema file problem is solved by removing a plug-in from a secondary file) improved management of the reboot notepad+ - faster initial support for a run-in-installation backup recurring option to set how often plugin manager should check for updates plugin - minimum 5 days column headers can now be clicked to order the plugin in different path orders for the plugin configuration files shown in the settings dialog box, making it easier to identify the installation type latest updates added, then, on future updates, the update notice will be displayed on the notification window, and also on the update tab. Stability column added to the list, with the ability to hide unstable ones (by default enabled) the novelties can now be added to the description, using , whichtheir easier to read ability to highlight an unstable version (aka bad,) which means that a lower version number is notified for the upgrade. For example, version 1.2 plugin is good, then 1.5 is released. plugin manager updates to 1.5, so stability reports arrive at about 1.5 not being stable. the xml can be updated so that the latest version is 1.2, and 1.5 marked as unstable. who updated to 1.5 will then be asked if they want to update again to 1.2. Plugins.xml and the validation database are now hosted on sourceforge solved a problem with deletion of plugins - the plugin file is removed correctly solved a potential crash problem if a temporary download file could not be opened for writing solved a problem if the plugin configuration directory needs multiple levels creating a pair of tidy ups code 0.9 plugins that are installed several times are now supported, and can be updated manually file nameAdded structure in XML to set the name of an unknown plugin based on a hash value - so that a plugin that returns a dynamic name can still be supported (the dynamic name will still be shown in the list to the user, however, but install and update will be possible) The user-agent header for all downloads now contains the version number of the fixed plugin manager a problem if the user said no to restart after removal of the plugins So, I hope you find this plugin useful, and gives a little more exposure to the plugins, and makes it easier to install some of the larger plugins. If you don't see your plugin on the list, let me know (see contact at the end) and I'll make sure it goes. To install the plugin manager, just download (link below) the .zip and place the PluginManager. dll file in the directory Notepad++ plugins, and gpup. exe in the directory of the update under the directory of the Notepad++ program. (e.g. "C:\Program Files\Notepad++\updater") In fact, if you prefer, simply add the PluginManager.dll to the plugin directory, then reinstall Plugin Manager from the plugin itself, which will put the file in the right place! Of course, if you are already using a previous version of the plugin manager, you will be able to update only from the update card (or when you get the notification that the update happened). Official address: The source code is on github: MD5 Sums:PluginManager_1.4.3_UNI.zip 5.5.4.3. older versions can be obtained at xml structure is documented here for completeness. to change the xml please use the admin system the xml file consists of elements each with a name attribute, containing information about each plugin. the name attribute must correspond (include case) to the name provided by the getname(,) i.e. what appears in the plugins menu in notepad+. from 0.9 onwards, a pluginnames element can be used, containing pluginname elements, to specify the name of a plugin, if it dynamically reports it. md5sum is given a file to identify it. e.g.
