There is also a "system information" area, which shows details about the computer and operating system if you are looking for a driver updater Easy-to-use, driver booster is probably your best bet . In our tests, we do not find errors with downloads and installs never caused problems such as BSOD errors or Hardware. Upgrades are not released in a web browser, so you do not have to download these drivers manually, as you may have to with other Driver UPDater tools. This is too much of a hassle that can even dissuade some of upgrading your drivers, and you can sometimes lead to click on the incorrect download link. The program is able to scan properly unless an active Internet connection is established (some driver updates do not need a network connection for verification). It will be similar to it is working, but without access to the network, it simply will scan without using any factual update information, which results in displaying an incorrect set of updates (or none). Because there is also a professional version of driver booster, some characteristics are limited in the free version. For example, more driver updates are found in the Professional Program and features such as download and backup of automatically program drivers and updates automatically, There are options in the free edition. Note carefully what you are by clicking during the initial installation. You can be prompted to add another program to your computer that is not related to the driver update. Thanks for letting us know! Tell us why! The computer contains all types of hardware, such as disk drives, DVD / CD-ROM drives, network and sound cards and video cards as well as external devices such as printers, keyboards, monitors and USB drives. When you install an operating system (OS), such such Windows or Linux, which the operating system needs to be able to talk to the hardware on your computer to display items, play sounds and video and record data or read data from a bundle, as well as other tasks. This is where the drivers enter. A driver is a small software that acts as a translator between a device and the operating system and programs that use the device. The driver tells the operating system and installed software programs, such as talking to the hardware on your computer. For example, when you buy a printer, it usually comes with a driver on a CD (or, in the last few years, a URL to download the latest Internet driver software) that tells the operating system how to print information on each Pan Gina. Without the driver, the printer will not know how to interpret the data sent to it if the data reaches the printer. Note: Many drivers, such as keyboard drivers and mouse drivers, are already installed with the operating system when you purchase a computer. View the drivers in the Device Manager The drivers installed on your system that speaks with hardware devices are managed using Device Manager. To access the Device Manager in Windows, enter the Device Manager in the Search box in the Start menu. All your hardware device categories, such as audio / outputs, video adapters, DVD / CD-ROM drives, network cards and mice and other pointer devices are listed and specific devices are The listed below each title. If you are having problems with a device, it is useful to know the driver version currently installed on your system. You may need to send this information to the manufacturer or say on the phone. It is also useful if you are trying to find a solution on the internet in several websites and musters. To discover the version of a driver, click the right mouse button on the driver in the Device Manager and select Properties from the pop-up menu. In the Properties dialog box, click the Driver tab. The driver provider, the date, the version and the subscriber are listed. You can find out more information about the driver using the driver details button. Note that you can also update the driver from this tab, disable the driver, uninstall the driver, and even revert the software driver for the previously installed version in case an update caused a problem with the device. NOTE: You can also update the driver software using the option to update software driver from the pop-up menu shown in the previous image. You can also download the drivers updated directly from the manufacturer's website to the specific device, as for a video or sound card. When you download the manufacturer's drivers, the driver software comes in an install file with an assistant that leads you to the installation. In this case, you update the driver directly, not through Device Manager. Generally, it is a good practice not to fix what is not broken. If your computer is working well, you probably do not need to update your drivers. In my previous post about if you should update your BIOS, I have come to the same conclusion. You should try to do it only if you have a problem with a device. However, an exception can be for video cards. If youans ¢ re using a video card, the update for the latest version of the manufacturer, instead of using the genetic driver that comes with Windows NVIDIA or ATI / AMD, can make a difference Noticeable speed and graphic quality. Be sure to use the right drivers for your devices. This is more important most of the time than using the latest drivers. Sometimes Windows automatically installs device drivers. However, you can prevent windows from doing You may want to back up your device drivers if you need to reinstall Windows on the same computer. If you are installing Windows on a different computer, you need to install fresh drivers if your computer has a different hardware. There are some useful tools that make it easy to back up or update the device drivers from your computer. Enjoy! Enjoy! Enjoy!
