Download video from url android github. Download image from url android. Download video from url android programmatically. Download video from url android. How to download file from url in android programmatically. Android download pdf from url. Download gif from url android. How to download file from url in android programmatically kotlin.

If you enter online sweepstakes, you'll hear the term "URL" frequently. For example, a friend might tell you to go to a certain URL, or you could discover that you can receive extra entries for sharing a URL on social media. If you're not very computer-savvy, you might be confused. What does URL mean? What does it stand for? And why are they important? Here's a quick and easy guide to understanding URLs, which will make it easier for you to enter online sweepstakes and, in general, to navigate the internet. "URL" is an acronym that stands for Universal Resource Locator. You might know it as the text that you type into your internet browser when you want to go to a website. In its most common form, a URL starts with "http://" or "https://" followed by "www," then the website name. That can then be followed by the address of directories on that web page, followed by the location of specific pages. For example, the URL for Contests and Sweepstakes on The Balance Everyday is . When you want to visit the site, you simply open your web browser and type that URL into the address field. A specific page on that website would have a longer URL. For example, here's the URL to the page about how lottery pools work: . The web page is the "resource" that your browser is "locating" for you with a URL. The "universal" part of the URL acronym comes in because URLs can help you locate other types of resources as well, including images, videos, PDF files, and more. A URL is also called a web address because it works like a house address. You can use a house address to find the location of a friend's home or store you want to visit. Your browser uses a URL to tell it where to go to find the web page you want to visit. Internet address is another synonym for URL. URLs are meant to be easy for people to remember and to use. However, computers need information presented to them in a different way. Your web browser finds web pages using an IP, or Internet Protocol. The IP is a series of numbers, which look something like: 69.171.224.11. Imagine if you had to remember a number like that for every website that you wanted to visit. The internet would not have become so popular if that were the case! It's far easier to use a word-based URL like . Furthermore, not every site has a static, or permanent, IP. Some IPs change on a regular basis, which would make it nearly impossible to go directly to the websites you want to visit. So instead of trying to memorize IPs, we use URLs, which generally stay the same and make sense to our brains. When you type a URL into an address field, your web browser uses something called a DNS (Domain Name Server) to translate the URL to the corresponding IP. The browser can then use the IP number to bring you to your desired destination. A URL usually looks something like this: It (usually, but not always) starts with "http://" or "https://" it is often followed by "www" Then the name of the website you want to visit Followed by specific directories where the information you want to read is stored, separated by / marks Finally, the location of the page you want to read. Take, for example, The HGTV Dream Home Sweepstakes page has this URL: . To compare it with the breakdown above, this URL: Starts with followed by www. And then the name of the website: hgtv.com. Followed by a directory: sweepstakes. And finally, the specific page you're looking for: hgtv-dream-home. If you want, you can click the link above to be brought to that page and see for yourself how it works. Links are not the same as URLs, though sometimes people say "link" when they mean "URL." For example, "Type the link into your web browser." A link is a clickable snippet of text associated with a URL. Clicking on the link brings you to the page the URL points to. This saves you time, letting you easily explore associated web pages without having to copy and paste URLs into your browser. In most browsers, if you hover over a link, holding your mouse over it without clicking it, you can see the associated URL at the bottom of the browser window. It's a good idea to do this before clicking on any link, so you know where that click brings you. A URL that starts with "https://" indicates that you're on a secure site. That means that if you enter personal information on that site, it will be encrypted before it's transmitted. Encrypted information cannot be easily intercepted by hackers. Any website that requests sensitive information, such as credit card information, should use a secure protocol in its URLs so that your information cannot be intercepted and misused. Many sweepstakes websites will use https in the URL of their entry forms so your personal information is safe when you submit your entry. Read How-to-Geek's What Is HTTPS and Why Should I Care? for more information. Simple problems demand simple solutions, and Android developers are happy to oblige. Say your daily work with your smartphone or tablet involves a lot of juggling URLs left and right, copying and pasting them in emails, messages, documents, and social networks. In such cases, using a URL shortener is the way to go - unless you are OK with web addresses taking one line or more from your message. But imagine you had to send several links one after another in the same message, or heck, in individual messages. Condensing each URL through a shortener like bit.ly or goo.gl for brevity is a task than can move from mildly annoying to a laborous, frustrating task-switching, copy-pasting ordeal in the course of a day. The process is crying to be automated, which is where ShortPaste comes to your aid. ShortPaste runs quietly in your Android device's system background and monitors the clipboard for URLs. When you copy an URL, ShortPaste instantly converts it to a shortened address that becomes readily available for pasting. What a godsend! Download the app from Google Play (it's free) and let us help you set up this helpful assistant. 1. Open ShortPaste after installation. The app's main screen gives you access to an archive of shortened URLs, a Settings panel, and the option to choose your preferred URL shortener, which can be either bit.ly or goo.gl. Just tap on the "Powered by" drop menu. 2. The next step is to head to the Settings panel. Tap the gear icon and you'll be presented with a list of options. Activate "Start on boot" to get ShortPaste to load with Android - that's pretty much a no-brainer. Activating "Trim header" lets you automatically shave off the 'http://' part of a shortened URL if you would like that for some reason. You can also input a bit.ly custom username if you wish. 3. We're almost done! It's time to auto-shorten some URLs! As you swing concise web addresses left and right like nobody's business, ShortPaste's 'Archive' gets filled with them and lets you easily copy them anytime. ShortPaste still needs some work on better optimization and tools for managing entries in the archive, but the core functionality is in there, and it rocks. Happy auto-shortening! By Chris Brake i dress bar image by Wiktor Osiecki from Fotolia.com Many online video Websites do not include an option for users to download a copy of the video directly. But there are many online video downloading Websites that exist specifically to enable downloading of online videos. In order to use these Websites to download a video, users must first know how to copy and paste the video URLs. Open a Web browser and load an online video. Double-click the address bar at the top of the Web browser to select the video's URL. Right-click on the selected URL, then click "Copy" from the context menu that appears. The URL will now be stored to the clipboard. Go to a video downloading Website such as ClipNabber, VideoDL or File2HD. Right-click the empty URL text box and select "Paste" from the context menu to paste the video URL from the clipboard. Click the "Nab," "Get It" or "Get" button to view the download link for the video file. Right-click on the video download link and select "Save As" to download the file to the hard drive. At a Glance Downloads any video with a URL Converts to common video file types Only integrates into Firefox for YouTube Download and convert videos from thousands of sites with this standalone utility. There are a lot of video downloaders out there, but few are as slick and easy on the eye as standalone utility Freemake Video Downloader v3.5. The program will download video from any site that you can snag a URL from—and if you're using YouTube and Firefox, you can even download using a button that the program embeds below the video being viewed. Not bad for a free program. "Friendly and easy-on-the-eye" sums up Freemake Video Downloader's interface. The Freemake Video Downloader interface couldn't be simpler. A large "paste" button in the upper left corner of the main window pastes any copied URL into the program. You'll need to grab the URL from the address bar of your browser, or by some other manual means. This method makes the program usable with any browser, but it's also not as convenient as an add-on such as Video DownloadHelper, which I use with Firefox. Freemake leverages its existing video conversion technology (found in the company's very capable Freemake Video Converter) to convert download videos, if you choose. You can either pre-set the conversion settings (the program will convert any video to MP4, FLV, WebM, or 3GP) for one-click downloading and conversion, or choose a format for each download. After you've pasted in a URL and selected the conversion format (if any), it's just a matter of waiting till the video downloads. There's a handy play button next to each completed download that will launch your default video player. Freemake converts videos to several different formats and sizes. Other Freemake Video Downloader options include interfacing with social media sites such as Facebook, Nicovideo, VKontakte, Yandex, YouTube, and Mail. RU (yes, Freemake serves an international audience.); proxy connections; and filtering of adult icons and content. Freemake Video Downloader is free, but if you'd like to show your appreciation, you can use the donation button. When not downloading, the main window advertises the company's other software, all of which is equally free and effective. Note that the program installs two services, but you're asked at installation and given a chance to not share anonymous statistics. If you're looking for a simple and effective way to download Web video, as well as convert it to the popular format of your choice, it doesn't get much better than Freemake Video Downloader. And you can't argue with the price. Note: The Download button on the Product Information page takes you to the vendor's site, where you can download the latest version of the software.
